

# Novice Difficulties in Graph Layering for Algorithm Design

Hongxuan Chen, Katherine Braught, Geoffrey L. Herman, Jeff Erickson

Siebel School of Computing and Data Science, The Grainger College of Engineering, University of Illinois Urbana-Champaign

## GRAPH LAYERING

“Find the shortest s-t walk whose length is divisible by 3.”

Have you seen this type of question in your class?

**RQ: How do students struggle with this technique?**

## THINK-ALOUD INTERVIEWS[2]

- 15 participants from an algorithm course
- 1-hour long interviews
- Thematic analysis [1]
- Inspired by Shindler et al. [3] and Zehra et al. [4]

## 2 Mazes X 2 Requirements

Number Maze

3	5	7	4	6
5	3	1	5	3
2	8	3	1	4
4	5	7	2	3
3	1	3	2	★

3	5	7	4	6
5	3	1	5	3
2	8	3	1	4
4	5	7	2	3
3	1	3	2	★

Arrow Maze

→			↓	
	→	←		↓
	↑	↓	→	→
↑			←	
	→	↑	←	★

→			↓	
	→	←		↓
	↑	↓	→	→
↑			←	
	→	↑	←	★

Requirement #1: Length *divisible by 5*.

Requirement #2: *Each of the four directions* at least once.

## DIFFICULTIES OBSERVED

1. Using dynamic programming, but it is impossible to construct a shrinking recursion.  
"This is DP"    "Both could work"    "This is Graph Layering"
2. Greedy solution based on misconceptions of BFS/Dijkstra's, such as “continue running”, “find the next path”, etc.  
**DO:**  
 Find the next shortest walk;  
**UNTIL** (the walk meets the requirement)
3. Incorrect graph layering construction.  
 For *length divisible by 5*: layer with “total length” or “maximum number on the grid”.

For *all directions*: layer with “number of directions visited” or “one layer for one direction”.

**WHY ARE THESE APPROACHES FLAWED?**

## NEXT STEPS

- Full paper in progress
- New course materials to explicitly teach this
